

**MORE GRUNT FOR COMPACT EXCAVATOR**

Based on its successful TB016, the new Takeuchi TB219 full hydraulic compact excavator is being released by Semco at Civenex 2010 in Sydney next month.

With 365kg more weight than its predecessor, the TB219 produces 3.0 kW more power and an additional 21 percent hydraulic flow. Other enhancements include greater reach and longer stick for added dig depth as well as greater lifting capacity.

The TB219 's higher performance is matched by an ability to access the same 980mm width sites as the previous model, plus the ability to spread a further 30mm stance for added stability.

A heavier counterweight is unobtrusively contained within the slim design and a heavy version dozer blade has the ability to widen to 1370mm. Time saving quick-fit pins mean no tools are required for extensions.

The standard machine configuration comes with a craning valve and an OROPS canopy and fully equipped with a set of three buckets, mud bucket and half-hitch. A cabin version, complete with a radio and iPod jack, will also be available on indent only basis.
